

# Physics 207 – Lecture 11

"Professor Goddard does not know the relation between action and reaction and the need to have something better than a vacuum against which to react. He seems to lack the basic knowledge ladled out daily in high schools."  
*New York Times* editorial, 1921, about Robert Goddard's revolutionary rocket work.

"Correction: It is now definitely established that a rocket can function in a vacuum.  
 The 'Times' regrets the error."  
*New York Times* editorial, July 1969.

Physics 207: Lecture 11, Pg 1

### Partial Survey Summary

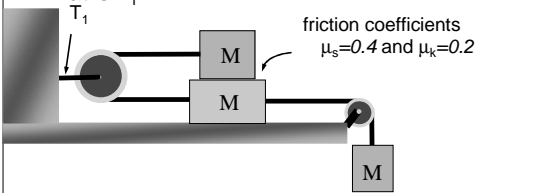

**Lecture**

- Too many slides that come too quickly
- More problem solving on white board
- Too much time spent on "interactive problems but, when used, not enough time spent on explanation
- More demos

Physics 207: Lecture 11, Pg 2

### Another example with friction and pulley

- Three 1 kg masses are connected by two strings as shown below. There is friction between the stacked masses but the table top is frictionless.
- Assume the pulleys are massless and frictionless.
- What is  $T_1$ ?

Physics 207: Lecture 11, Pg 3

### Physics 207, Lecture 11, Oct. 10

Agenda:

- Chapter 9: Momentum & Impulse
  - ❖ Momentum conservation
  - ❖ Collisions
  - ❖ Impulse

Assignment:

- Read through Chapter 10
- MP HW5 available now, due Wednesday 10/17, 11:59 PM

Physics 207: Lecture 11, Pg 4

### Impulse & Linear Momentum

- **Transition from forces to conservation laws**

Newton's Laws → Conservation Laws  
 Conservation Laws → Newton's Laws

They are different faces of the same physics phenomenon.

NOTE: We already have studied "impulse" and "momentum" but we have not explicitly named them as such

Physics 207: Lecture 11, Pg 5

### Lecture 11, Example 1

A 2 kg cart initially at rest on frictionless horizontal surface is acted on by a 10 N horizontal force along the positive x-axis for 2 seconds what is the final velocity?

- $F$  is in the x-direction  $F = ma$  so  $a = F/m = 5 \text{ m/s}^2$
- $v = v_0 + a t = 0 \text{ m/s} + 2 \times 5 \text{ m/s} = 10 \text{ m/s}$  (+x-direction)

What if the mass had been 4 kg?  
 What is the new final velocity?

Physics 207: Lecture 11, Pg 6

## Physics 207 – Lecture 11

### Twice the mass

- Same force
- Same time
- Half the acceleration
- Half the velocity ! ( 5 m/s )

Physics 207: Lecture 11, Pg 7

### Example 1

- Notice that the final velocity in this case is inversely proportional to the mass (i.e., if thrice the mass....one-third the velocity).
- It would seem that mass times the velocity always gives the same value. (Here it is always 20 kg m/s.)

Physics 207: Lecture 11, Pg 8

### Example 1

- There are many situations in which the product of “mass times velocity” is a constant and so we give a special name, “momentum” and associate it with a conservation law.  
(Units: kg m/s or N s)
- A force applied for a certain period of time can be plotted and the area under this curve is called “impulse”

Physics 207: Lecture 11, Pg 9

### Example 1 with Action-Reaction

- Now the 10 N force from before is applied by person (me) and I happen to be standing on a frictionless surface as well and I am also initially at rest.
- What is the force on me and for how long ?

Physics 207: Lecture 11, Pg 10

### Example 1 with Action-Reaction

- The 10 N force from before is applied by person (me) and I happen to be standing on a frictionless surface as well and I am also initially at rest.
- What is the force on me and for how long ?
- 10 N but in the  $-x$  direction
- 2 seconds

Physics 207: Lecture 11, Pg 11

### Example 1 with Action-Reaction

- The 10 N force from before is applied by person (me) and I happen to be standing on a frictionless surface as well and I am also initially at rest.
- What is the force on me and for how long ?
- 10 N but in the  $-x$  direction
- 2 seconds
- And what is my final velocity ( $V$ ) if I'm mass “ $M$ ” ?
- $V = a t = F/M t$  in the  $-x$  direction

Physics 207: Lecture 11, Pg 12

# Physics 207 – Lecture 11

## Example 1 with Action-Reaction

- The 10 N force from before is applied by person (me) and I happen to be standing on a frictionless surface as well and I am also initially at rest.
- What is the force on me and for how long ?
- 10 N but in the  $-x$  direction
- 2 seconds
- And what is my final velocity (V) if I'm mass "M" ?
- $V = F/M t$  in the  $-x$  direction
- but rearranging gives  $MV = Ft = -20 \text{ kg m/s}$
- And notice that the total momentum before and after (that of the cart and myself) remained zero.
- This is the essence of momentum conservation

Physics 207: Lecture 11, Pg 13

## Applications of Momentum Conservation

Radioactive decay:

Explosions

Collisions

Physics 207: Lecture 11, Pg 14

## Impulse & Linear Momentum

- **Definition:** For a single particle, the momentum  $\mathbf{p}$  is defined as:

$$\mathbf{p} \equiv m\mathbf{v} \quad (\mathbf{p} \text{ is a vector since } \mathbf{v} \text{ is a vector})$$

So  $p_x = mv_x$  and so on (y and z directions)

- Newton's 2<sup>nd</sup> Law:  $\mathbf{F} = m\mathbf{a}$

$$= m \frac{d\mathbf{v}}{dt} = \frac{d}{dt}(m\mathbf{v}) \Rightarrow \mathbf{F} = \frac{d\mathbf{p}}{dt}$$

- This is the most general statement of Newton's 2<sup>nd</sup> Law

Physics 207: Lecture 11, Pg 15

## Momentum Conservation

$$\mathbf{F}_{\text{EXT}} = \frac{d\mathbf{P}}{dt} \Rightarrow \frac{d\mathbf{P}}{dt} = 0 \Leftarrow \mathbf{F}_{\text{EXT}} = 0$$

- Momentum conservation (recasts Newton's 2<sup>nd</sup> Law when  $\mathbf{F} = 0$ ) is a fundamentally important principle.

- A vector expression ( $P_x$ ,  $P_y$  and  $P_z$ ).

- ❖ And applicable in any situation in which there is NO net external force applied.

Physics 207: Lecture 11, Pg 16

## Momentum Conservation

- Many problems can be addressed through momentum conservation even if other physical quantities (e.g. mechanical energy) are not conserved

Physics 207: Lecture 11, Pg 17

## Collisions always conserve momentum if not acted upon by an external force

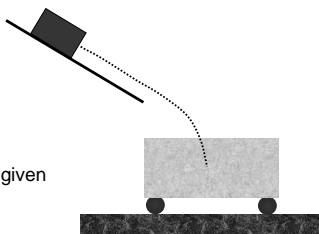

Physics 207: Lecture 11, Pg 18

# Physics 207 – Lecture 11

**Lecture 11, Exercise 1**  
**Momentum is a Vector (!) quantity**

- A block slides down a frictionless ramp and then falls and lands in a cart which then rolls horizontally without friction
- **After** the block leaves the ramp is momentum conserved?

A. Yes  
 B. No  
 C. Yes & No  
 D. Too little information given

Physics 207: Lecture 11, Pg 19

**Lecture 11, Exercise 1**  
**Momentum is a Vector (!) quantity**

- This is a really hard problems because once the block leaves the rail there is no net external force in the x-direction but there are lots of external forces in the y-direction. First gravity acts on the block and then the earth acts on the cart + block. So if the cart and block comprise the "system" then momentum is conserved in the x-direction and NOT conserved with respect to the y-direction motion. The rain and in the boat homework problem is best understood in this context.

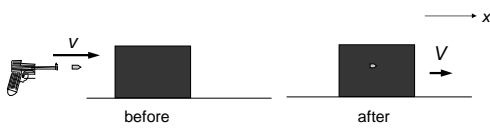

- Answer: Yes (x-direction) and No (y-direction)

Physics 207: Lecture 11, Pg 20

**Inelastic collision in 1-D: Example 2**

- A block of mass  $M$  is initially at rest on a frictionless horizontal surface. A bullet of mass  $m$  is fired at the block with a muzzle velocity (speed)  $v$ . The bullet lodges in the block, and the block ends up with a speed  $V$ . In terms of  $m$ ,  $M$ , and  $V$ :

What is the momentum of the bullet with speed  $v$  ?

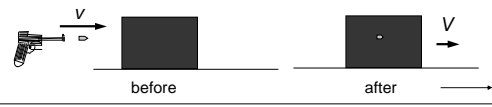

Physics 207: Lecture 11, Pg 21

**Inelastic collision in 1-D: Example 2**

What is the momentum of the bullet with speed  $v$  ?  $m\vec{v}$

❖ Key question: Is x-momentum conserved ?

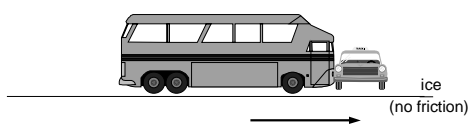

*Before*                      *After*  
 $mv + M \cdot 0 = (m + M)V$

Physics 207: Lecture 11, Pg 22

**Lecture 11, Example 2**  
**Inelastic Collision in 1-D with numbers**

*Do not try this at home!*

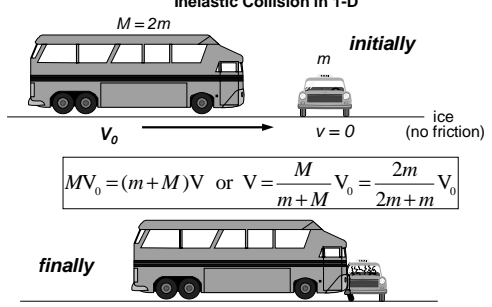

**Before:** A 4000 kg bus, twice the mass of the car, moving at 30 m/s impacts the car at rest.

What is the final speed after impact if they move together?

Physics 207: Lecture 11, Pg 23

**Lecture 12, Example 2**  
**Inelastic Collision in 1-D**

$MV_0 = (m + M)V$  or  $V = \frac{M}{m + M} V_0 = \frac{2m}{2m + m} V_0$

**finally**  $2V_0/3 = 20 \text{ m/s}$        $v_f = ?$

Physics 207: Lecture 11, Pg 24

# Physics 207 – Lecture 11

**Lecture 11, Exercise 2  
Momentum Conservation**

- Two balls of equal mass are thrown horizontally with the same initial velocity. They hit identical stationary boxes resting on a frictionless horizontal surface.
- The ball hitting box 1 bounces elastically back, while the ball hitting box 2 sticks.

❖ Which box ends up moving fastest ?

A. Box 1  
 B. Box 2  
 C. same

Physics 207: Lecture 11, Pg 25

**A perfectly inelastic collision in 2-D**

- Consider a collision in 2-D (cars crashing at a slippery intersection...no friction).

- If no external force momentum is conserved.
- Momentum is a vector so  $p_x$ ,  $p_y$  and  $p_z$

Physics 207: Lecture 11, Pg 26

**Elastic Collisions**

- Elastic means that the objects do not stick.
- There are many more possible outcomes but, if no external force, then momentum will always be conserved
- Start with a 1-D problem.

Physics 207: Lecture 11, Pg 27

**Elastic Collision in 1-D**

Physics 207: Lecture 11, Pg 28

**Force and Impulse  
(A variable force applied for a given time)**

- Gravity: usually a constant force to an object
- Springs often provides a linear force ( $-k x$ ) towards its equilibrium position
- Collisions often involve a varying force  
 $F(t): 0 \rightarrow \text{maximum} \rightarrow 0$
- We can plot force vs time for a typical collision. The impulse,  $J$ , of the force is a vector defined as the integral of the force during the time of the collision.

Physics 207: Lecture 11, Pg 29

**Force and Impulse  
(A variable force applied for a given time)**

- $J$  reflects momentum transfer

$$\vec{J} = \int^t \vec{F} dt = \int^t (d\vec{p} / dt) dt = \int^p d\vec{p}$$

Impulse  $J$  = area under this curve !  
(Transfer of momentum !)

Impulse has units of Newton-seconds

Physics 207: Lecture 11, Pg 30

# Physics 207 – Lecture 11

### Force and Impulse

- Two different collisions can have the same impulse since  $J$  depends only on the momentum transfer, NOT the nature of the collision.

$\Delta t$  big,  $F$  small                       $\Delta t$  small,  $F$  big

Physics 207: Lecture 11, Pg 31

### Average Force and Impulse

$\Delta t$  big,  $F_{av}$  small                       $\Delta t$  small,  $F_{av}$  big

Physics 207: Lecture 11, Pg 32

### Lecture 11, Exercise 3 Force & Impulse

- Two boxes, one heavier than the other, are initially at rest on a horizontal frictionless surface. The same constant force  $F$  acts on each one for exactly 1 second.

Which box has the most momentum after the force acts ?

light

heavy

A. heavier  
 B. lighter  
 C. same  
 D. can't tell

Physics 207: Lecture 11, Pg 33

### Boxers:

Physics 207: Lecture 11, Pg 34

### Back of the envelope calculation

$$\vec{J} = \int^t \vec{F} dt = \vec{F}_{avg} \Delta t$$

(1)  $m_{arm} \sim 7 \text{ kg}$  (2)  $v_{arm} \sim 7 \text{ m/s}$  (3) **Impact time  $\Delta t \sim 0.01 \text{ s}$**

→ **Impulse**  $J = \Delta p \sim m_{arm} v_{arm} \sim 49 \text{ kg m/s}$

→  $F \sim J/\Delta t \sim 4900 \text{ N}$

(1)  $m_{head} \sim 6 \text{ kg}$

→  $a_{head} = F / m_{head} \sim 800 \text{ m/s}^2 \sim 80 \text{ g}!$

- Enough to cause unconsciousness  $\sim 40\%$  of fatal blow

Physics 207: Lecture 11, Pg 35

### Woodpeckers:

Physics 207: Lecture 11, Pg 36

## Physics 207 – Lecture 11

During "collision" with a tree, nominally

$$a_{\text{head}} \sim 600 - 1500 \text{ g!!}$$

### How do they survive?

- Jaw muscles act as shock absorbers
- Straight head trajectory reduces damaging rotations (rotational motion is very problematic)

Physics 207: Lecture 11, Pg 37

Physics 207, Lecture 11, Oct. 10

Assignment:

- Read through Chapter 10
- MP HW5 available now, due Wednesday 10/17, 11:59 PM

Physics 207: Lecture 11, Pg 38
